Disclosure of Financial Relationships

Vizient, Inc., Jointly Accredited for Interprofessional Continuing Education, defines companies to be ineligible as those whose primary business is producing, marketing, selling, re-selling, or distributing healthcare products used by or on patients.

An individual is considered to have a relevant financial relationship if the educational content an individual can control is related to the business lines or products of the ineligible company.

No one in a position to control the content of this educational activity has relevant financial relationships with ineligible companies.

REFLECTION

Learning Objectives

- Discuss leading practices for improving patient safety, healthcare quality and outcomes.
- Describe strategies that promote continuous learning and improvement.
- Discuss case law updates related to the Patient Safety Work Product privilege.

Opening Remarks

THE NATURE OF ADVERSE EVENTS IN HOSPITALIZED PATIENTS

Results of the Harvard Medical Practice Study II

LUCIAN L. LEAPE, M.D., TROYEN A. BRENNAN, M.D., J.D., M.P.H., NAN LAIRD, PH.D.,
ANN G. LAWTHERS, SC.D., A. RUSSELL LOCALIO, J.D., M.P.H., BENJAMIN A. BARNES, M.D.,
LIESI HEBERT, SC.D., JOSEPH P. NEWHOUSE, PH.D., PAUL C. WEILER, LL.M., AND HOWARD HIATT, M.D.

Abstract Background. In a sample of 30,195 randomly selected hospital records, we identified 1133 patients (3.7 percent) with disabling injuries caused by medical treatment. We report here an analysis of these adverse events and their relation to error, negligence, and disability.

Methods. Two physician-reviewers independently identified the adverse events and evaluated them with respect to negligence, errors in management, and extent of disability. One of the authors classified each event according to type of injury. We tested the significance of differences in rates of negligence and disability among categories with at least 30 adverse events.

Results. Drug complications were the most common type of adverse event (19 percent), followed by wound infections (14 percent) and technical complications (13 percent). Nearly half the adverse events (48 percent) were associated with an operation. Adverse events during sur-

gery were less likely to be caused by negligence (17 percent) than nonsurgical ones (37 percent). The proportion of adverse events due to negligence was highest for diagnostic mishaps (75 percent), noninvasive therapeutic mishaps ("errors of omission") (77 percent), and events occurring in the emergency room (70 percent). Errors in management were identified for 58 percent of the adverse events, among which nearly half were attributed to negligence.

Conclusions. Although the prevention of many adverse events must await improvements in medical knowledge, the high proportion that are due to management errors suggests that many others are potentially preventable now. Reducing the incidence of these events will require identifying their causes and developing methods to prevent error or reduce its effects. (N Engl J Med 1991; 324:377-84.)

Leape LL, Brennan TA, Laird N, Lawthers AG, Localio AR, Barnes BA, Hebert L, Newhouse JP, Weiler PC, Hiatt H. The nature of adverse events in hospitalized patients: results of the Harvard Medical Practice Study II. *New England journal of medicine*. 1991 Feb 7;324(6):377-84.

Table 1. Screening Criteria for Adverse Events.

1. Hospitalization within previous year for patients less than 65 years old and previous six months for older patients
2. Admission to any hospital after this discharge
3. Previous failure of medical management or unfavorable results
4. Trauma incurred in hospital
5. Unfavorable drug reaction in hospital
6. Transfer from general care to a special care unit
7. Transfer to another acute care hospital
8. Return to operating room during this period of hospitalization
9. Treatment for organ damage after an invasive procedure
10. Acute myocardial infarction, cerebrovascular accident, or pulmonary embolus during or after an invasive procedure
11. Neurologic deficit at discharge
12. Death
13. Temperature higher than 38.3°C on day before or day of discharge
14. Cardiac or respiratory arrest
15. Five-minute Apgar score <6, or complication of abortion or labor and delivery
16. Other undesirable outcome
17. Indication of litigation in the medical record
18. Length of hospital stay above 90th percentile for diagnosis-related group in patients under 70, and 95th percentile in those 70 or older

Hiatt, HH, Barnes, BA, Brennan, TA, et al. A study of medical injury and medical malpractice: an overview. N Engl J Med 1989;321:480-484

Incidence of Adverse Drug Reactions in Hospitalized Patients

A Meta-analysis of Prospective Studies

Jason Lazarou, MSc; Bruce H. Pomeranz, MD, PhD; Paul N. Corey, PhD

Objective.—To estimate the incidence of serious and fatal adverse drug reactions (ADR) in hospital patients.

Data Sources.—Four electronic databases were searched from 1966 to 1996.

Study Selection.—Of 153, we selected 39 prospective studies from US hospitals.

Data Extraction.—Data extracted independently by 2 investigators were analyzed by a random-effects model. To obtain the overall incidence of ADRs in hospitalized patients, we combined the incidence of ADRs occurring while in the hospital plus the incidence of ADRs causing admission to hospital. We excluded errors in drug administration, noncompliance, overdose, drug abuse, therapeutic failures, and possible ADRs. Serious ADRs were defined as those that required hospitalization, were permanently disabling, or resulted in death.

Data Synthesis.—The overall incidence of serious ADRs was 6.7% (95% confidence interval [CI], 5.2%-8.2%) and of fatal ADRs was 0.32% (95% CI, 0.23%-0.41%) of hospitalized patients. We estimated that in 1994 overall 2 216 000 (1 721 000-2 711 000) hospitalized patients had serious ADRs and 106 000 (76 000-137 000) had fatal ADRs, making these reactions between the fourth and sixth leading cause of death.

Conclusions.—The incidence of serious and fatal ADRs in US hospitals was found to be extremely high. While our results must be viewed with circumspection because of heterogeneity among studies and small biases in the samples, these data nevertheless suggest that ADRs represent an important clinical issue.

JAMA. 1998;279:1200-1205

METHODS

Definitions

One step we took to reduce heterogeneity was to exclude any data that did not use the following specific definitions:

Adverse Drug Reaction (ADR).—According to the World Health Organization definition,⁸ this is any noxious, unintended, and undesired effect of a drug, which occurs at doses used in humans for prophylaxis, diagnosis, or therapy. This definition excludes therapeutic failures, intentional and accidental poisoning (ie, overdose), and drug abuse.⁸ Also, this does not include adverse events due to errors in drug administration or non-compliance (taking more or less of a drug than the prescribed amount).⁸ Using this conservative definition avoids overestimating the ADR incidence.

For editorial comment see p 1216.

Recently, some authors prefer the term

Lazarou J, Pomeranz BH, Corey PN. Incidence of Adverse Drug Reactions in Hospitalized Patients: A Meta-analysis of Prospective Studies. *JAMA.* 1998;279(15):1200-1205. doi:10.1001/jama.279.15.1200

Diagnostic error – state of science

Somewhat like adverse drug event evidence circa 2000

- Disparate data on prevalence of diagnostic errors, few data on underlying causes
- Growing interest in policies and procedures
- Fundamentally limited by our ability to measure ‘diagnostic excellence’
- Maybe not building on what the safety world has learned so far....

Diagnostic error prevalence and causes: The UPSIDE study

REFLECTION

- Elderly woman with chronic heart failure underwent hysteroscopy for a uterine mass, procedure complicated by uterine perforation.
- Admitted to Medicine in the evening for mild hypoxemic respiratory failure, thought due to intraperitoneal volume and acute heart failure.
- Patient's primary symptom at time of transfer is abdominal pain.

REFLECTION

Did an error happen?

Clinical course should have prompted earlier reconsideration of working diagnosis

Diagnostic testing should have prompted earlier reconsideration

Physical exam suggested alternate diagnosis

We agreed that an error took place

REFLECTION

What were the contributors?

- Inaccurate or misinterpreted exam
- Failure to order needed tests (CT)
- Failure to recognize urgent condition
- Failure or delay in ordering referral to surgery
- Suboptimal consultation coordination/communication
- Overweighing lower likelihood diagnosis

Return to our case example

Interpretation of documentation by our adjudicators

- Considered possible bowel perforation
- Gynecology service did not have concern for pathology related to the procedure but more concerned about pulmonary process
- Reassurance from Gynecology service contributed to late engagement of general surgery

Now do that 2427 more times.....

- **23%** of patients had a diagnostic error
- Errors caused temporary or permanent harm, or death in **18%**.
- In patients who died, a diagnostic error contributed to death in **7%**

Contributors to errors

Diagnostic Process faults	Prevalence (%)
Access/presentation faults	11%
Errors in history taking	15%
Errors in physical exam	3%
Errors in testing	9%
Errors in follow-up and monitoring	5%
Errors in obtaining referrals	4%
Errors in teamwork	1%
Errors in communication	0.3%
Errors in assessment	12%

REFLECTION

Lessons Learned

- Diagnosis is hard
- Diagnostic errors are common and harmful in seriously ill patients
- There are key processes, such as testing, clinical follow-up, and assessment, that may be high priorities for the future.

Key Takeaways

- Diagnostic process improvement is an achievable goal
 - New needs
 - A process for identifying errors
 - A process for coaching and guiding clinicians
 - But can build on a lot of things hospitals and safety programs already do well
 - System change
 - Training and educating clinicians

Indiana University Health

Emergency Department Rapid Intake and Split Flow Model Improves Throughput

Steven Roumpf, MD, MBA

Associate Chief Medical Officer

Medical Director and Section Chief Emergency Medicine

Indiana University Health and Indiana University School of Medicine

REFLECTION

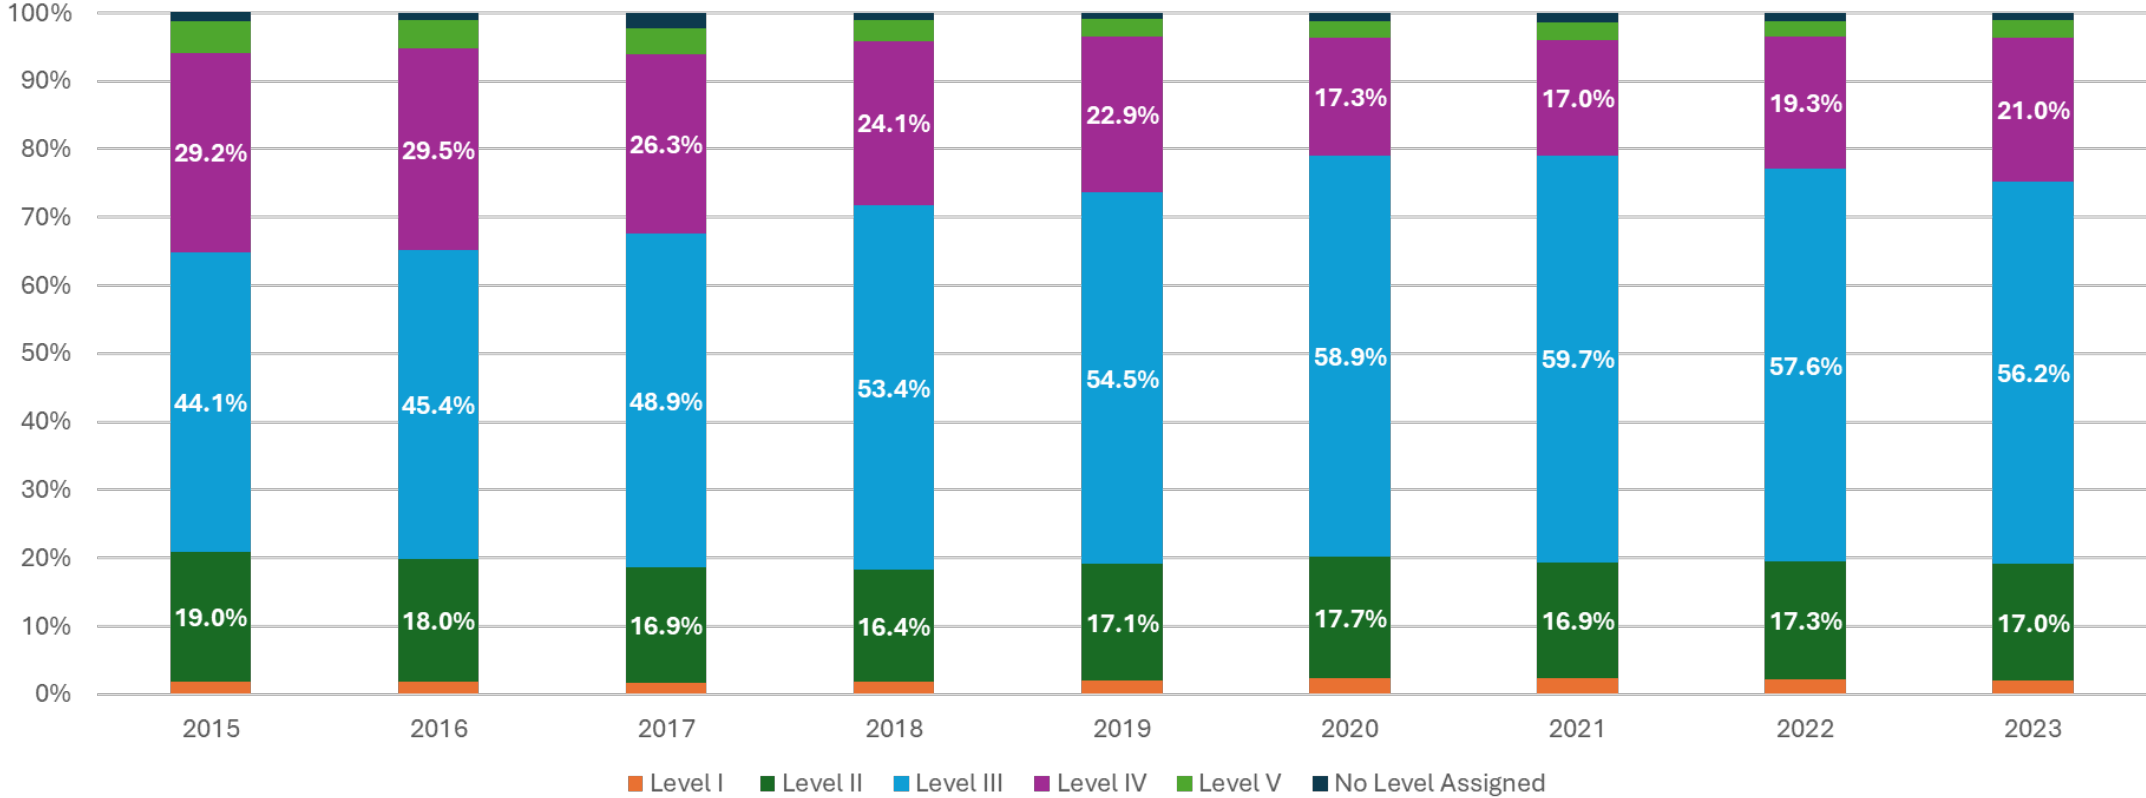

Reason for Action

- Progressive decrease of low acuity patients (Emergency Severity Index (ESI) 4/5) while mid-level (ESI 3) acuity patients have increased
- Marked increase in ED boarding
- Increasing wait times
- Undesirable Left Without Being Seen (LWBS) rate
- Flow of ESI 3 patients discharged to home hindered by inpatient holds
- Needed a rapid assessment and split-flow model for patients likely to be discharged home
 - “Vertical Flow” vs ESI acuity segregation
 - Space limited, but similar design and flow model to IU Health Medical Center future ED design

Accelerate Care Unit (ACU) Criteria

ACCELERATED CARE UNIT (ACU)

ACU appropriate criteria

- Able to sit up comfortably
- Not in severe pain
- Not anticipating prolonged workup or admission

Patient examples:

- Headache
- Non traumatic flank pain
- Non-Pregnant vaginal bleeding
- Isolated extremity swelling or injury
- Mild asthma exacerbation
- Back pain (ambulatory)
- Chest pain < 30 years old with normal EKG
- Respiratory complaint with normal sPO2
- Minor head injury
- Well appearing nausea/vomiting/diarrhea
- Urinary complaints
- Minor epistaxis (nosebleed)
- Simple Abscess
- Minor MVC

ACU NOT appropriate criteria

- Needing to lay down
- Pregnancy/postpartum related complaints
- Likely to be admitted
- Pre-arrivals / consults
- Complex wound closures
- Needs orthopedic reduction
- Mental status change (intoxication, etc.)
- High fall risk

Patient examples:

- Elderly abdominal pain
- Dyspnea > age 50
- Weak/dizzy
- GI bleeding
- Syncope / near syncope
- Sickle cell patients
- Psychiatric patients

Resources	Not Resources
Labs, Blood Urine	History & Physical (including pelvic)
ECG	Point of Care Testing
X-Ray CT MRI Ultrasound Fluids (hydrations, angiography)	Saline or heplock
IV Fluids (hydrations)	PO Medication
IV IM or Nebulized medications	Tetanus immunization
Specialty Consults	Prescription Refills
Simple procedures =1 lac repair/foley)	Phone call to PCP
Complex procedure =2 conscious sedation)	Simple wound care (dressing -recheck)
	Crutches, splints and slings

Resources: Count number of different types of resources, not individual tests or x-rays (ex: CBC, electrolytes, and coags = 1 resource; CBC + Chest X-Ray = 2 Resources)

Source: IU Health. Permission to use.

Significant Headwinds 2022-2023

↑ 4% ADC

↑ 1% admission rate

↑ ↑ 13% Boarding Hours (>1000 hours per month)

Data Source: IU Health Enterprise Analytics Emergency Department (ED) Cube_02

REFLECTION

Results

- ↓ LOS for treat and release by 9 minutes
- ↓ Time for decision to admit by 13 minutes
- ↓ Median door to provider by 6 minutes
- ↓ Left without being seen by 1%

★ Patient experience in the ACU was consistently 9-10 points higher than the rest of the ED

Data Source: IU Health Enterprise Analytics Emergency Department (ED) Cube_02

Results ACU Volume

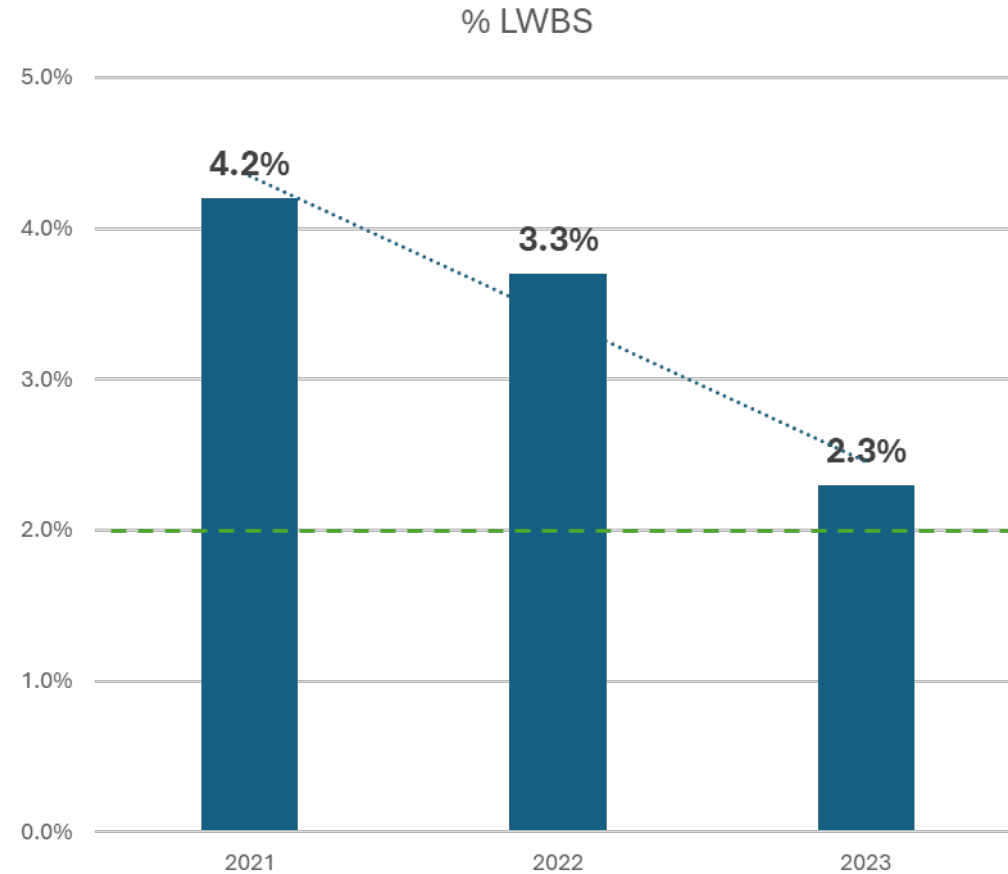

↑ in % of total ED average daily census (14% → 19%, ~ 12-15 patients/day)

- Especially impactful on **high volume days**
- Higher **complexity** patients (vs previous “Fast Track” model)
- Goal is 25% (2024 is up to 22%)

Data Source: IU Health Enterprise Analytics Emergency Department (ED) Cube_02

Results: Left Without Being Seen – Target < 2%

- 1% Decrease in LWBS from 2022 to 2023
- Decline in waiting room length of stay

Data Source: IU Health Enterprise Analytics Emergency Department (ED) Cube_02

New IU Health Downtown Medical Campus Under Construction Opening late 2027

New ED Rapid Intake Space

- 3 intake screening rooms
 - 8 “vertical” recliners
 - 14 beds
 - 30 results waiting/inner waiting room
 - 46 WR chairs
- ACU allows team members to trial new workflows/concepts in preparation for the new ED
 - Establish best practice
 - Team member engagement

Lessons Learned

- Adoption of new workflow isn't easy
- Sustainment is even harder
- Stakeholder accountability
 - Active engagement
 - 2-way communication
 - Support adherence to role expectations
 - Responsiveness to concerns
- Adaptability
 - Flexibility in approach
 - Adjust strategies and processes
 - Use data to support and drive actions

Key Takeaways

- **Multidisciplinary team** drives success and sustainment
- **LEAN** Rapid Improvement Event format was key to implementation
- "Lower/**Vertical**" Acuity vs ESI segregation promoted overall efficiencies
- **Standard Work** for all roles
 - Specific actions/tasks, with focused on quality and timely care delivery
 - Consistent repeatable processes to hardwire new practice standards
- **Communication** and Training Plans
 - Multiple channels/modes to share data, feedback and ask questions
 - Written documentation with 1:1 team member training
- **Budget Neutral**
 - Leveraging existing assets
 - Maximize internal resources
 - Piloted without additional FTEs

REFLECTION

Patient Portal Messaging Has Surged

- Physicians receive 57% more patient portal messages than they did before the COVID-19 pandemic.¹
- Digital engagement boom: 46% more patients access portals since 2020.²
- Health systems experienced a significant increase in workload to clinical care teams.^{3, 4}

Impact on Our System

- More than 3 million messages sent in the last 2 years
- 1 million forwarded directly to the physician

Opportunity to transform the deluge of portal messages

- Triage
- Improve access for patients with complex messages—leverage telehealth
- Develop and implement standardized workflows: high reliability journey

Source: Froedtert & Medical College of WI MyDA database.

Addressing the Challenges

Infrastructure

- Data
- Access
 - Video visit rate: 5.3%
- Primary care v. Specialties
- Guidelines/workflows, visibility to help triage

Clinical Practice

- Teams
- Culture and trust
- Dependence on physician to respond to portal messages
- Burnout, involvement, buy-in
- Unclear way to triage portal messages
- Guidelines/workflows, variability

Source: Froedtert & Medical College of WI MyDA database.

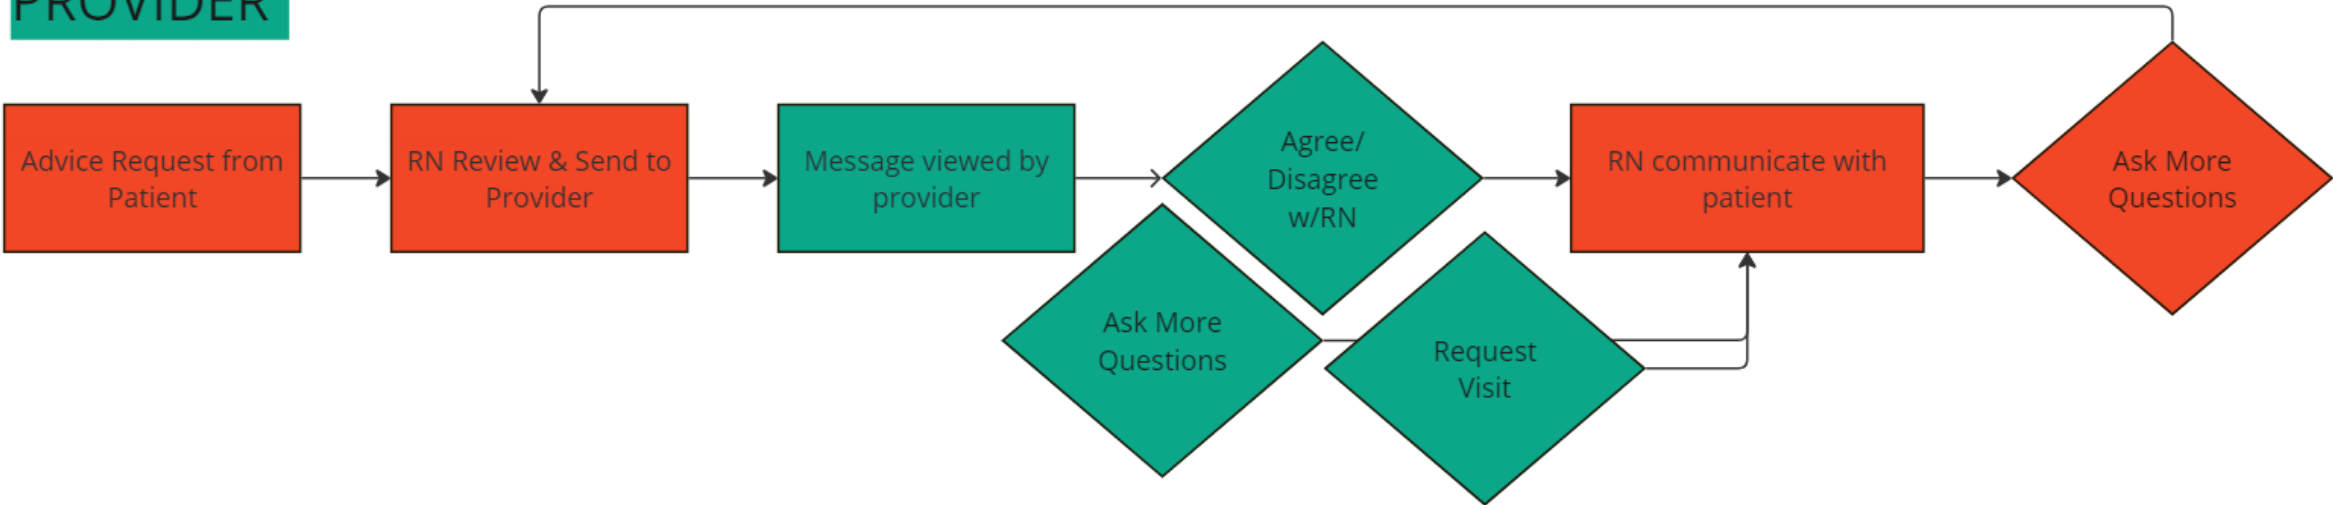

Our Hypotheses

Offering patients a timely, APP led video visit (VV) will result in faster response to complex needs, less messages hitting primary care physician inbox and increase VV utilization overall

Lessons Learned

Boosters

- Team approach to the project
- Analytics support & PDSA
- Leadership & rounding
- Patient response
- Aligning incentives and approaches

Barriers

- Portal structure for the patient to submit
- Protocols and tools for team to address needs with a top of license approach
- Infrastructure to "make it easy"
- Visibility into the problem

REFLECTION

Key Takeaways

- Patient connections to their clinical team between clinic visits ("asynchronous care") continue to increase, requiring novel solutions to finding balance for patients and clinicians
- We aligned enterprise priorities to address the deluge of patient portal messages, digital engagement, access, and telehealth to meet patient and clinician needs
- Proof of concept rapid iteration, intentional sustainability strategies, evolving infrastructure and addressing clinical practice challenges (culture) helped us to accelerate learnings and outcomes

Thank you!

Using AI to Improve End-of-Life Care

Nathan Moore, MD

Medical Director, BJC Accountable Care Organization
BJC Healthcare, St Louis, Mo.

Patrick White, MD, PhD

Stokes Family Endowed Chair and Chief of Palliative Medicine, Washington University in St. Louis
BJC Healthcare/Washington University, St Louis, Mo.

REFLECTION

- Advance care planning (ACP) is critically important for improving quality of care, increasing patient/family satisfaction, and reducing unnecessary costs
- ACP and palliative care are significantly underutilized in nearly every health system in the US
- Major barriers:
 - Accurate identification of high-risk patients
 - Engaging providers to participate in goals of care discussions

Electronic medical record data is obtained 24 hours after admission analyzing 500+ variables including:

1. Diagnoses
2. Vitals
3. Labs
4. Medications/therapies

Death or hospice occurred in 1.4% of low encounters, 5.2% of medium encounters, and 18% of high-risk encounters.

- Small group, in person trainings with standardized patients
- Semi automated alerts to providers
 - Hospital floor
 - ICU
 - Primary Care
- Phased rollout to 8 hospitals of various types

- Hospitalist Service
- Non-ICU
- Full code, no documented goals of care
- Jan – July 2021
- Community hospitals

Original Investigation | Health Informatics

Advanced Care Planning for Hospitalized Patients Following Clinician Notification of Patient Mortality by a Machine Learning Algorithm

Chi S, Kim S, Reuter M, Ponzillo K, Oliver DP, Foraker R, Heard K, Liu J, Pitzer K, White P, Moore N. Advanced Care Planning for Hospitalized Patients Following Clinician Notification of Patient Mortality by a Machine Learning Algorithm. JAMA Netw Open. 2023 Apr 3;6(4):e238795. doi: 10.1001/jamanetworkopen.2023.8795.

- 87% response rate
- **5x increase in documented advance care planning (ACP)**
- **ACP occurred 2x earlier** during hospitalization
- **3x higher rate of code status changes**

Next steps

- Home care patients
- Enhancing algorithm with unstructured data and notes
- Validating at external sites

Lessons Learned

- Providers are more likely to engage with champions from their own institution and feel that it is beneficial to patients and partners
- Collaboration between informatics, palliative care and hospital medicine is essential
- Providers are willing to engage in difficult conversations if they are given appropriate direction and training (even without financial incentives)

Key Takeaways

- We **can** do better for patients near the end of life
- Work backwards - algorithms are useless without appropriate clinical workflows and training
- Strive for high signal: noise to drive provider engagement

Essential Components

Mentoring and Support

- Standardize Cause Analysis education.
- Provide CA intervention and support.
- Implement simulation learning.

Problem Solving

- Collaborative problem-solving.
- Understand cause and effect.
- Application of analysis tool.

Data & Assessments

- Engage caregiver perspectives.
- Review for equitable patient experience.
- Evaluation of common cause.

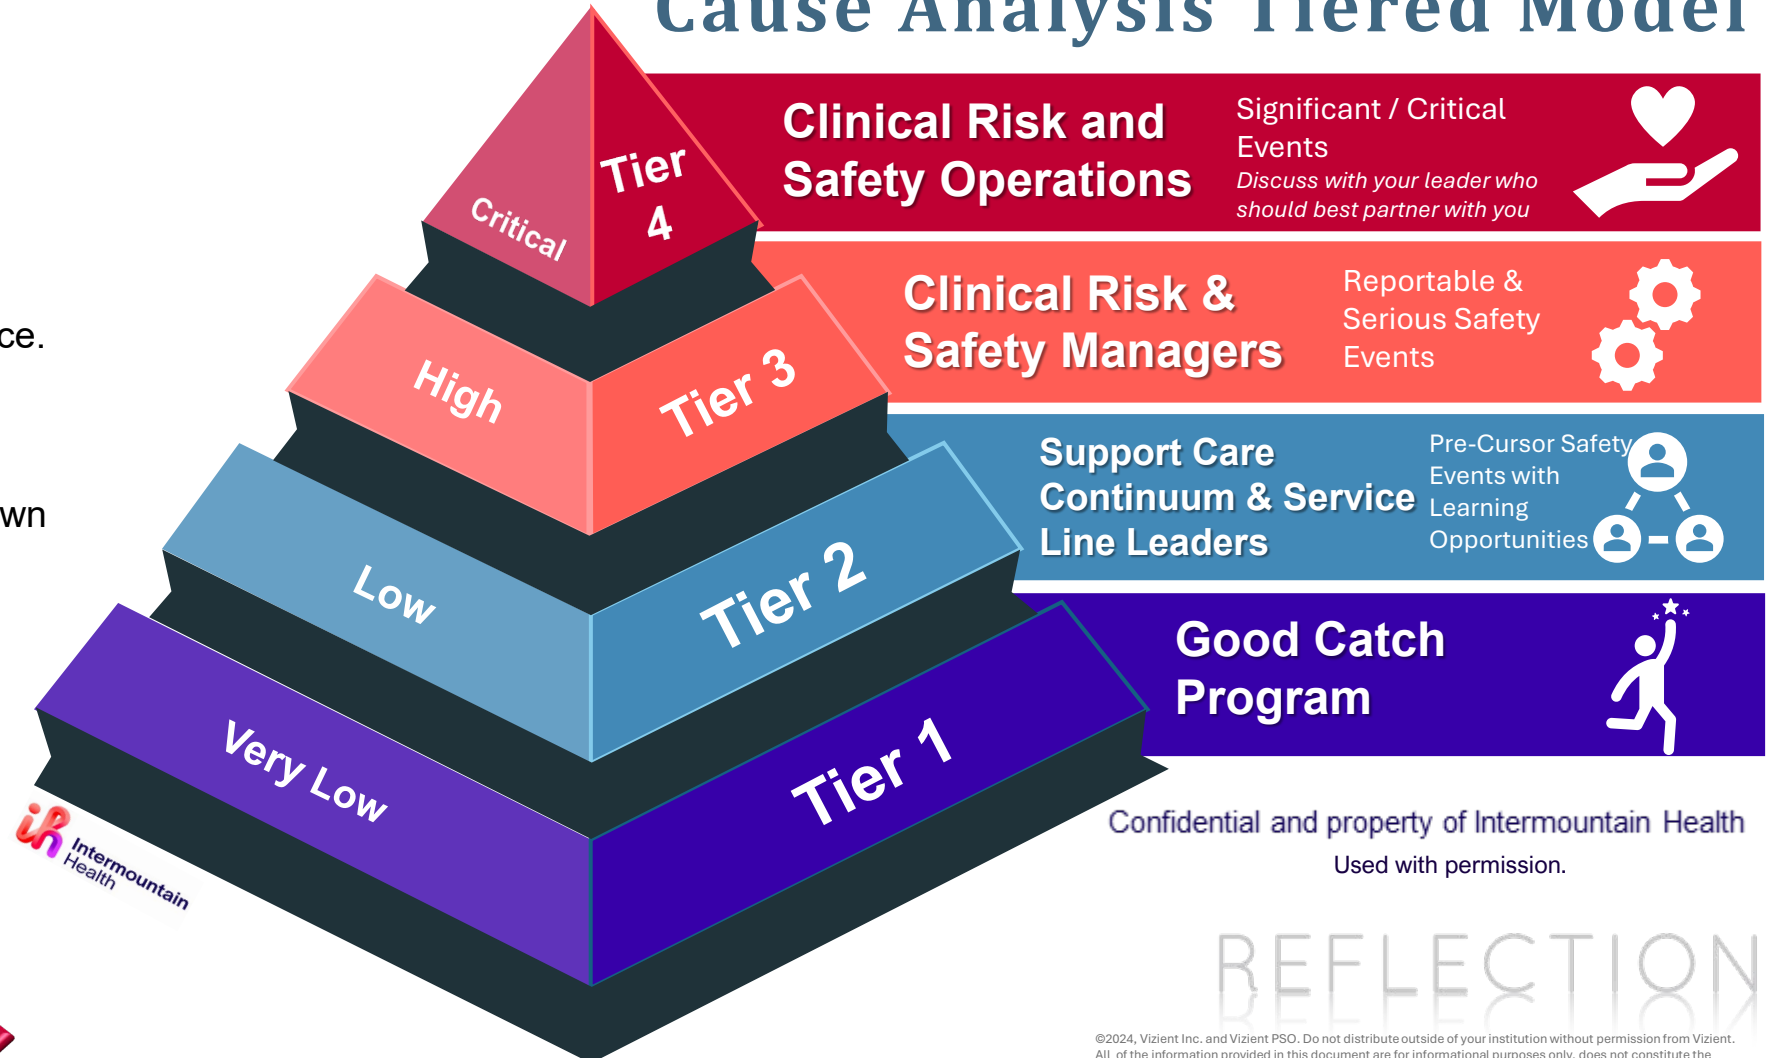

Stakeholder Engagement

- Solicit Executive Sponsor ownership.
- Empower leaders and caregivers to own safety.
- Close Loop with involved teams.

Solution Implementation

- Research based solutions.
- Include patient voice/experience.
- Involve caregiver champions.
- Engage interdisciplinary teams.
- Share solutions and lessons learned.
- Define measurements of success.
- Monitor action plans for sustainability.

The Cause Analysis tiered model is a fluid collaborative approach to finding opportunities and sharing solutions across the system.

Which of these circumstances/characteristics are *present* in this patient's journey?

HEALTH EQUITY DEFINITIONS

Health Equity: Ensuring that everyone has a fair and just opportunity to be as healthy as possible. This requires removing obstacles to health such as poverty, discrimination, and their consequences, including powerlessness and lack of access to good jobs with fair pay, quality education and housing, safe environments, and health care (Braveman et al., 2017).

Characteristic	Definition	Examples
Which of these circumstances or characteristics are present in this patient's journey?		
None	-	-
Age	Age is the amount of time that has passed since a person was born. It is often measured in years and can be used to describe how old a person is. Age impacts many aspects of life, including health, education, and social interactions.	<ul style="list-style-type: none"> Dismissing concerns due to age Agism Ability to complete activities of daily living Young pregnant patient Inability to manage care / understand expectations
BMI	Body mass index (BMI) is a measure of body fat based on height and weight that applies to adults. BMI screens for weight categories that may lead to health problems, but it does not diagnose the body fatness or health of an individual.	<ul style="list-style-type: none"> Furniture or equipment that does not accommodate people of size and may limit access to diagnostic studies Fatism (implicit bias towards people of size) Inability to complete activities of daily living Inability to access care due to transportation issues (unable to fit in vehicles)
Community	Community is defined as people and organizations who are impacted by the programming and solutions. These are people and organizations outside hospital walls but within a hospital's service area / town / city / county.	<ul style="list-style-type: none"> Identity based communities (e.g., LGBTQ community; Pacific Islander community; Deaf community) Community groups or community-based organizations Faith-based organizations Urban vs. rural disparities Value-based communities (e.g., plural family communities)
Culture Values, Attitudes, Awareness	Culture refers to the shared values, beliefs, and attitudes of a community or group. This can include a wide range of things, such as language, religion, food, social habits, music and arts, approach to healthcare, holiday celebrations, and death or funeral traditions. Culture is an important part of a person's identity and can influence their beliefs and behaviors.	<ul style="list-style-type: none"> Political affiliation Dress Tattoos Holistic/Homeopathic beliefs Marijuana use Tone of voice
Homelessness	Temporary, short-term, or long-term state of being without access to stable housing.	<ul style="list-style-type: none"> Unstable housing Discharge disposition Use of community resources
Interpersonal Violence Abuse, Assault, Neglect	The World Health Organization (WHO) defines violence as: "The intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community that either results in or has a high likelihood of resulting in injury, death, psychological harm, maldevelopment, or deprivation".	<ul style="list-style-type: none"> Child/Elder abuse Intimate partner violence Domestic violence Work-place violence (WPV) Community/Stranger violence
Medical Diagnosis	The process of identifying a medical condition or disease based on a person's symptoms, medical	<ul style="list-style-type: none"> Infectious Diseases (HIV, Rabies, COVID) Palliative Care Issues

Characteristic	Definition	Examples
Which of these circumstances or characteristics are present in this patient's journey?		
	history, and other diagnostic tests. It is typically made by a medical professional and will guide treatment and management of the condition.	<ul style="list-style-type: none"> Code Status Obesity
Mental Health or Behavioral Health	Emotional, psychological, and social well-being. A person's ability to function in everyday life and the behaviors exhibited based on their cognition and perceptions.	<ul style="list-style-type: none"> Addiction High utilization of healthcare related to diagnosis Extensive mental health history Depression Anxiety Suicidal ideation Schizophrenia Alert pop ups in medical record Drug seeking behavior / history of drug seeking in medical record
Neurodiversity	This refers to differences in how people think and understand the world around them, including differences in intellectual and cognitive capabilities.	<ul style="list-style-type: none"> ADHD Intellectual disabilities Autism spectrum Traumatic Brain Injuries (TBI) Dyslexia Dyspraxia
Physical Ability	This refers to physical traits that affect a person's ability to move around, such as their strength, endurance, or any visible conditions that affect their mobility.	<ul style="list-style-type: none"> Patients with ambulatory restrictions (prosthetics, wheelchair, walker, cane, etc.) Diagnosis that impacts their physical ability
Preferred Language	This refers to the language that a patient or family caregiver would like to use when receiving healthcare services. It does not have to be their first language, and they can choose to use English if they prefer.	<ul style="list-style-type: none"> Interpretation Services not available, offered or used Patient language not available on iPad Family member used for interpretation Discharge paperwork or other forms not available in patient's preferred language Patient is conversational in English but better understands healthcare in their preferred language (literacy) Medical explanations use too much jargon and are not at the correct reading / comprehension level
Race or Ethnicity	Race refers to a social construct that categorizes people based on shared physical traits, such as skin color. Ethnicity, on the other hand, refers to a social grouping of people who share common characteristics, such as language, nationality, geography, and cultural heritage. While race is often based on physical characteristics, ethnicity is based on cultural and social features.	<ul style="list-style-type: none"> Discrimination Racism Incorrect assumptions Cultural insensitivity Slang/slur White privilege
Religion or Spiritual Beliefs	Set of deeply held personal beliefs and practices that impact how individuals approach life, death, and healing.	<ul style="list-style-type: none"> Religion Spiritual beliefs Dietary restrictions Blood transfusions

Characteristic	Definition	Examples
Which of these circumstances or characteristics are present in this patient's journey?		
Sex, Gender, and Gender Identity	Sex refers to the anatomical organs a person has, such as a vagina, uterus, ovaries, penis, or testicles. Gender identity, on the other hand, is an individual sense of their own gender, such as being a woman, man, genderqueer, or nonbinary. Gender identity is internal and may not be visible to others. It is important to note that gender identity applies to all individuals, not just transgender or gender-nonbinary individuals.	<ul style="list-style-type: none"> Misgendering or using incorrect pronouns. Using "dead name" Caregiver unable to provide resources on gender affirming care Gender change
Sexual Orientation	This refers to a person's attraction to others, which can be physical, romantic, or emotional, or all. Sexual orientation is often described as straight, lesbian, gay, bisexual, or queer. It is important to note that gender identity and sexual orientation are not the same. For instance, transgender people can identify as straight, lesbian, gay, or bisexual. Similarly, lesbian, gay, and bisexual people can identify as cisgender.	<ul style="list-style-type: none"> Policies that do not consider same sex couples Bias associated with sexual orientation or identity
Societal Factors	Societal factors are the multifaceted conditions, circumstances, and causes that influence the health of patients. This includes social determinants of health (SDOH), social needs, safety, and systemic causes that are the fundamental causes of the social inequities that lead to poor health.	<ul style="list-style-type: none"> Racism Food deserts Sexism Generational poverty Redlining Toxic geographies
Socio-Economic Status Education, Income, Occupation	Complex measure of social standing that considers personal and household income as well as educational attainment, occupational prestige, and subjective perceptions of social status and social class. Socioeconomic standing (SES) includes a wide range of quality-of-life attributes and opportunities available to people within a society and is a consistent predictor of a vast array of health outcomes. In other words, a person's SES can impact their access to resources and opportunities that can affect their health and well-being (adapted from APA, 2019).	<ul style="list-style-type: none"> Healthcare Literacy Medical literacy Pre-natal care Underserved population Undocumented immigrants
Visual or Hearing Ability	This refers to how well a person can see or hear based on their physical abilities.	<ul style="list-style-type: none"> ASL interpretation not available, offered or used Corrective lenses or hearing aids Patient prefers to read lips but is unable to due to masks or other barriers Braille documents not available

Lessons Learned

- Creating a standard operating procedure document for the cause analysis process can create clarity amongst different teams that participate in the evaluation of an event and the improvement.
- Having a standardized centralized process helps to augment and encourage stronger departmental event review and follow-up.
- To ensure skills and confidence are sustained for effective cause analysis practices, provide ongoing training with tools and resources such as lunch n' learns, simulation exercises and mentoring support (an expert mentor dedicated to the cause analysis program).
- Partner with health equity experts to collect the correct data by objectively asking the right questions to capture equity characteristics present in the patient's journey.
- Provide education and training through simulation to ensure knowledge and skills of key stakeholders in facilitating conversations about equity issues.

REFLECTION

Key Takeaways

- A standardized process for triaging potential significant safety events, as well as templated follow up processes, helps to achieve consistent improvement and leadership accountability.
- Establish shared file for the quality and safety leadership team to review and track cases and their progress at defined intervals.
- A tiered cause analysis model improved caregiver and leader engagement, reduced time to implement solutions, and reduced action plan variation.
- Integrate health equity into safety event investigations by developing a comprehensive tool to capture equity characteristics present in the patient's journey.
- Identification of equity trends resulted in proactive partnerships with community health leaders surrounding interpersonal violence and suicide.

vizient.

Barnett Benvenuti & Butler PLLC

ATTORNEYS AT LAW

PSWP Case Law Update

Wes Butler

Partner Attorney

Barnett Benvenuti & Butler PLLC

REFLECTION

- Approximately 125 published decisions in legal reporters
- Most cases are in Federal court
 - 75 opinions from Federal courts – 6th, 9th, 10th, and 11th Circuits
 - 50 opinions from State courts – FL, VA, CA, PA, and KY
- General observations
 - Favorable opinions tend to focus on the text of the Act
 - Unfavorable opinions tend to find that the health care provider failed to prove the privilege applied
- Interesting trends
 - Increasing number of employment law cases addressing the PSWP privilege
 - Prison cases

Manazer v. Adena Health System

- U.S. District Court in Ohio – Federal court – June 12, 2024
 - James Manazer, M.D. – Chief of Surgery for 10 years before being terminated by Hospital
 - In 2022, 2 MDs began performing TVAR, but only one was credentialed to perform TAVR
 - Ohio State Medical Bd investigated and Dr. Manazer provided info, data and verbal reports to OSMB
 - Dr. Manazer claimed that info, data and verbal report were provided to Adena “intended for a PSO”
 - Hospital CEO asked Dr. Manazer to meet with reporters inquiring on TAVR
 - Dr. Manazer claims he was going to tell reporters the truth and not Adena’s version of the truth
 - An anonymous Facebook account reported on uncredentialed surgeons performing TAVR at Adena
 - Dr. Manazer denied being the Facebook account, but was terminated anyway
 - He alleged termination in violation of the PSQIA, defamation, and tortious interference

Manazer v. Adena Health System

- Federal Court dismissed Dr. Manazer’s PSQIA whistle-blower claim
 - PSQIA prohibits adverse employment actions taken because “an individual in good faith reported information” – 42 USC § 299b-22(e)
 - (A) to the provider with the intention of having the information reported to a PSO; or
 - (B) directly to a PSO
 - An individual that suffers an adverse employment action as a result of a good faith report may bring a civil action to obtain equitable relief – 42 USC § 299b-22(f)(4)(A)
 - Hospital argued that Dr. Manazer did not report directly to a PSO or with the intent that a report be forwarded to a PSO
 - Court found that Dr. Manazer failed to prove that he intended info to be forwarded to a PSO
 - Noted that neither Ohio State Medical Board or Adena are listed PSOs
 - Dr. Manazer offered no evidence of “intent” other than his claim
 - With the PSQIA claim dismissed, federal jurisdiction was lost, and the case was returned to State court

Manazer v. Adena Health Sys., No. 2:23-cv-2798, 2024 U.S. Dist. LEXIS 104475 (S.D. Ohio June 12, 2024)

REFLECTION

In re BayCare Medical Group

- U.S. Court of Appeals for the 11th Circuit – May 14, 2024
 - Hospital sought writ of mandamus to prohibit trial court from ordering production of quality files
 - Underlying case involves Dr. Loux claiming employment discrimination
 - Hospital claims Dr. Loux was fired for surgical errors
 - Dr. Loux sought discovery of Hospital's internal documents on the performance of other MDs
 - Hospital claimed that some of the files were privileged as PSWP
 - Specifically, quality files and referral logs stored in rIDatix database
 - Hospital described in detail its process for deciding whether to make a report to a PSO
 - Complaint → Referral to Quality Coordinator → Quality File for Dep't input → Clinical Risk → PSO
 - Hospital explained how it complied with State recordkeeping and reporting obligations w/o PSWP
 - Hospital created additional documents from a “separate system” to comply with State laws
 - Hospital acknowledged that info in rIDatix is used for more than just PSO reporting – e.g., RM, QA, PR or RCAs

REFLECTION

In re BayCare Medical Group

- U.S. Court of Appeals for the 11th Circuit – May 14, 2024
 - Magistrate Judge reviewed the documents *in camera* and recommended the PSWP privilege be applied
 - District Judge disagreed, saying the PSWP privilege does not apply if the info has a “dual purpose”
 - If info is not “solely to report to a PSO” then no PSWP privilege applies
 - This includes the use of such info for internal purposes, such as internal safety analysis and peer review
 - Plus, Dr. Loux needs the documents for her case
 - Federal CoA held that Hospital is entitled to a writ of mandamus because the District Court erred when it applied the wrong legal analysis
 - Hospital claimed “deliberations or analysis” prong on the PSWP definition and rIDatix contains its PSES
 - Question: Does the PSQIA have a “sole purpose” test for the PSWP privilege:
 - Court: No, a “sole purpose” test is not supported by the text of the PSQIA
 - Hospital “may use PSWP for any purpose within its legal entity.”
 - AHRQ’s 2016 Guidance is not law

In re BayCare Med. Grp., Inc., 101 F.4th 1287 (11th Cir. 2024)

- *Manazer*

- Does your PSES policy give internal reporters to your PSES an argument that when they reported to the PSES they intended the info to be forwarded to a PSO?
- Who decides whether info is submitted to the PSO?
- Are there intermediate steps before the decision to report to a PSO is made?
- Does your PSES policy make clear who has the right to assert the PSWP privilege?

- *In re BayCare*

- Have you developed a flowchart of your PSES process for PSO reporting?
- Have you identified potential “State mandated reports/records”?
- Is your defense counsel ready to argue on the nuances of the PSWP privilege?

Key Takeaways

- Assure that defense counsel makes a good record in the trial court on the PSWP privilege with an appeal in mind
- Many courts applying a “purpose” test for PSWP – be ready to cite *BayCare* as an advantage to your PSWP privilege claim
- PSO reporting is still a reliable part of the PSWP privilege argument
- Take a close look at your PSES policy with legal arguments in mind
